

Hosting a website on Windows Server EC2

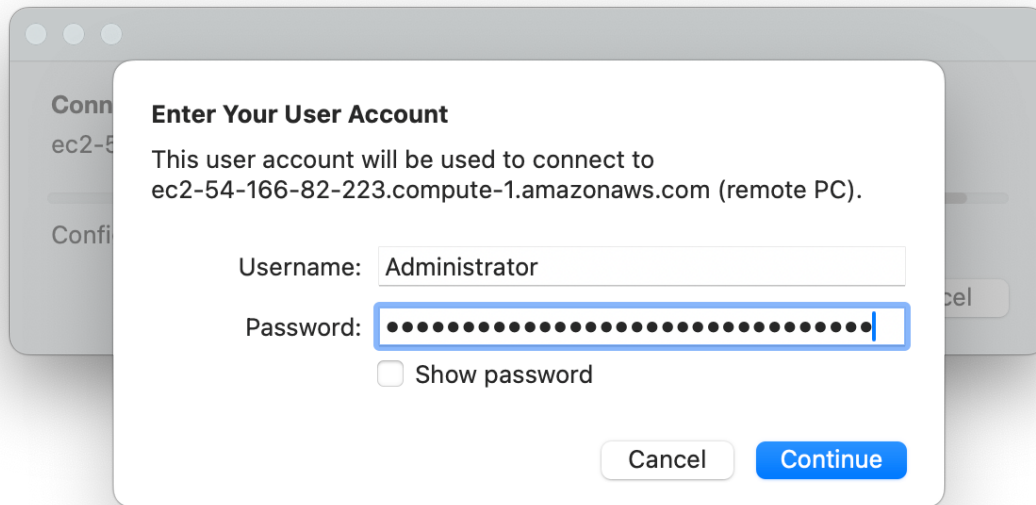

Create an EC2 with windows server as OS and enable rdt and http on security group

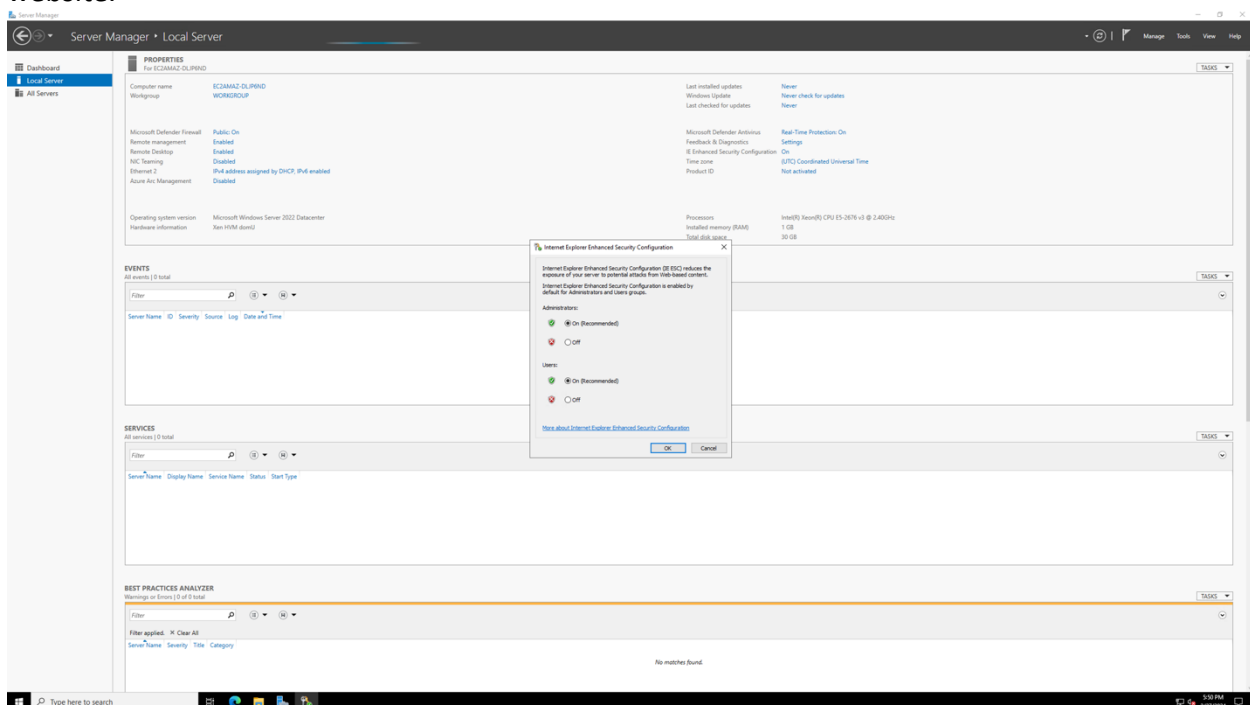

Lets generate password using the private key (pem file).

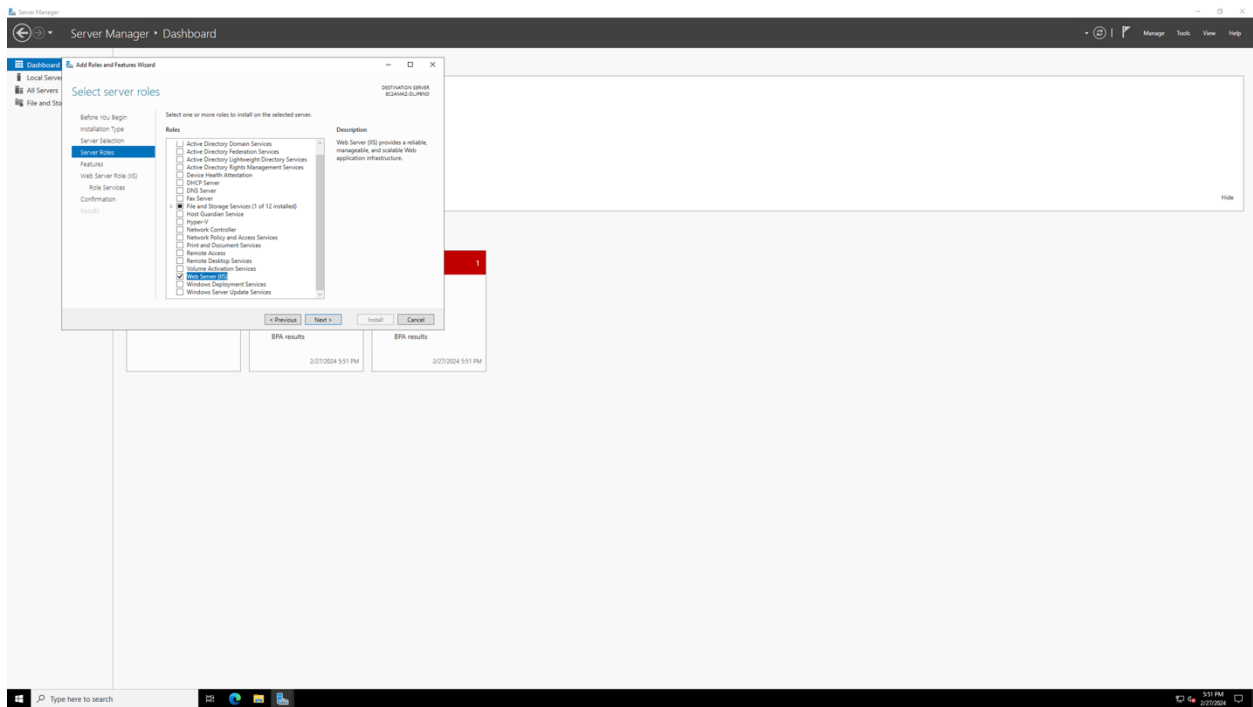

Connect to EC2 using Remote Desktop File using the password.

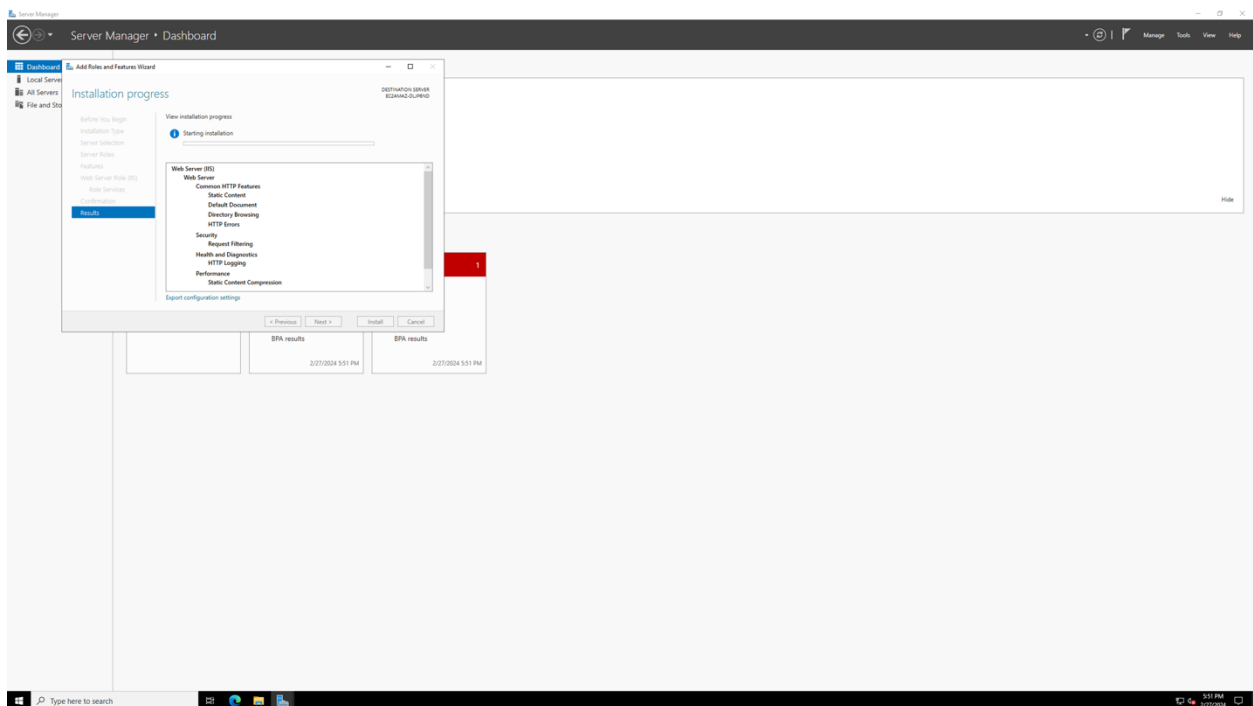

First lets turn off Enhanced Security Configuration so it does not ask us to whitelist every website.

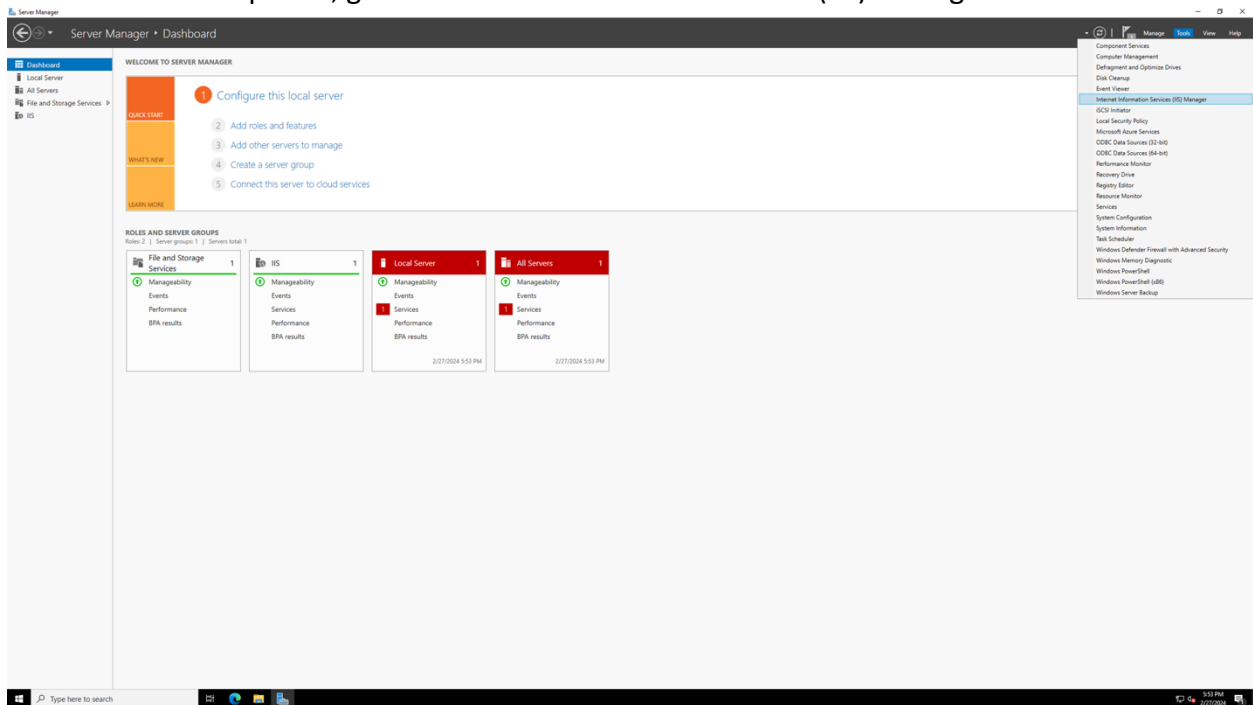

Install Web Server IIS

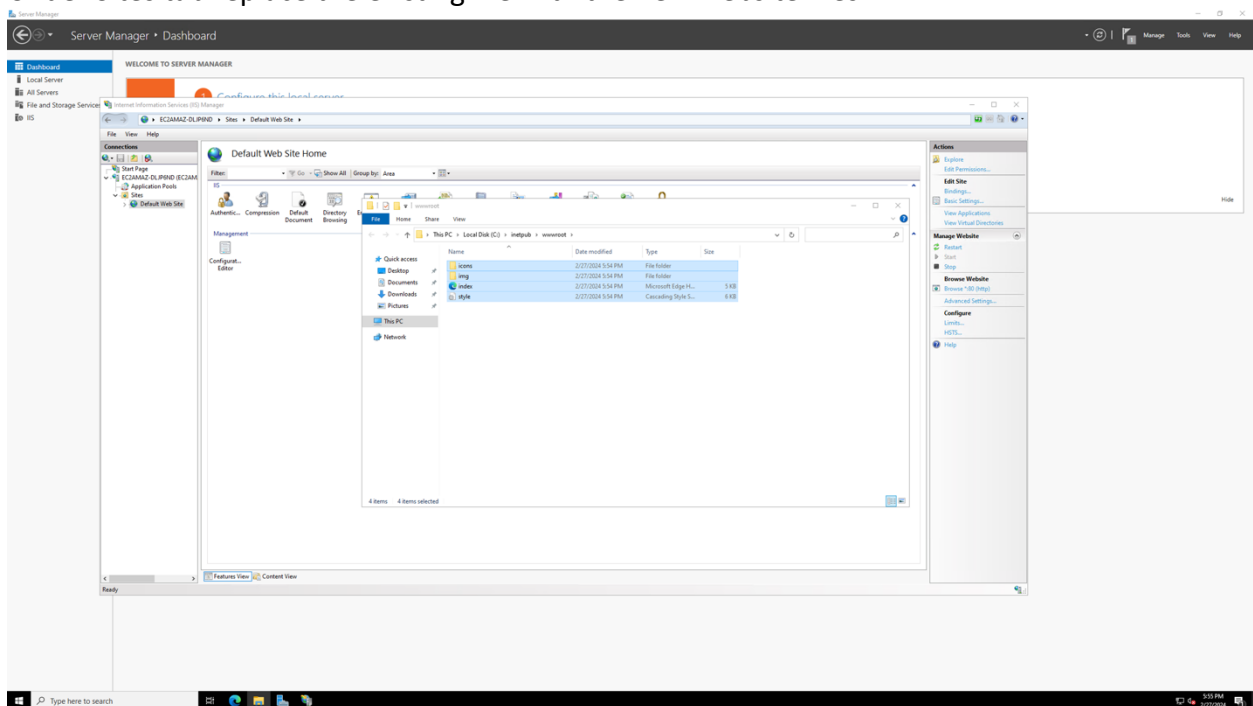

It may take a while to install.

Once install is completed, go to “Internet information services (IIS) Manager” from Tools

Under Sites tab replace the existing file with the new website files.

The site loads file using the public ip.
