

Hosting a website in S3

Now, I will host a static website in S3.

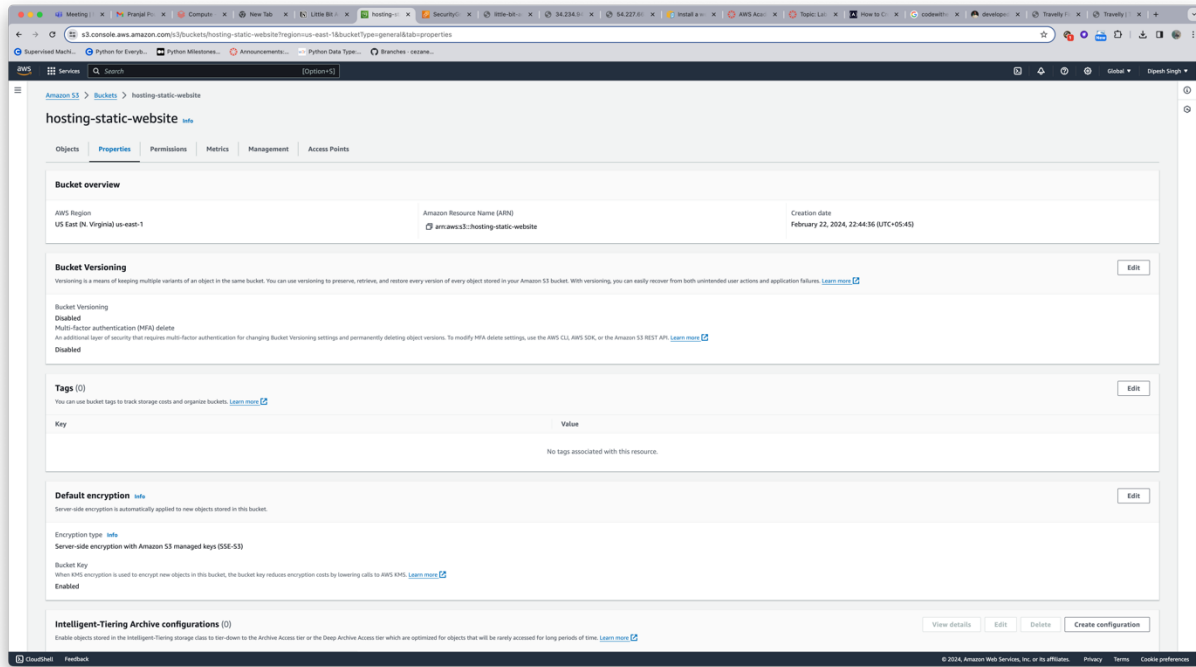

Go to S3 page and click “Create bucket” button.

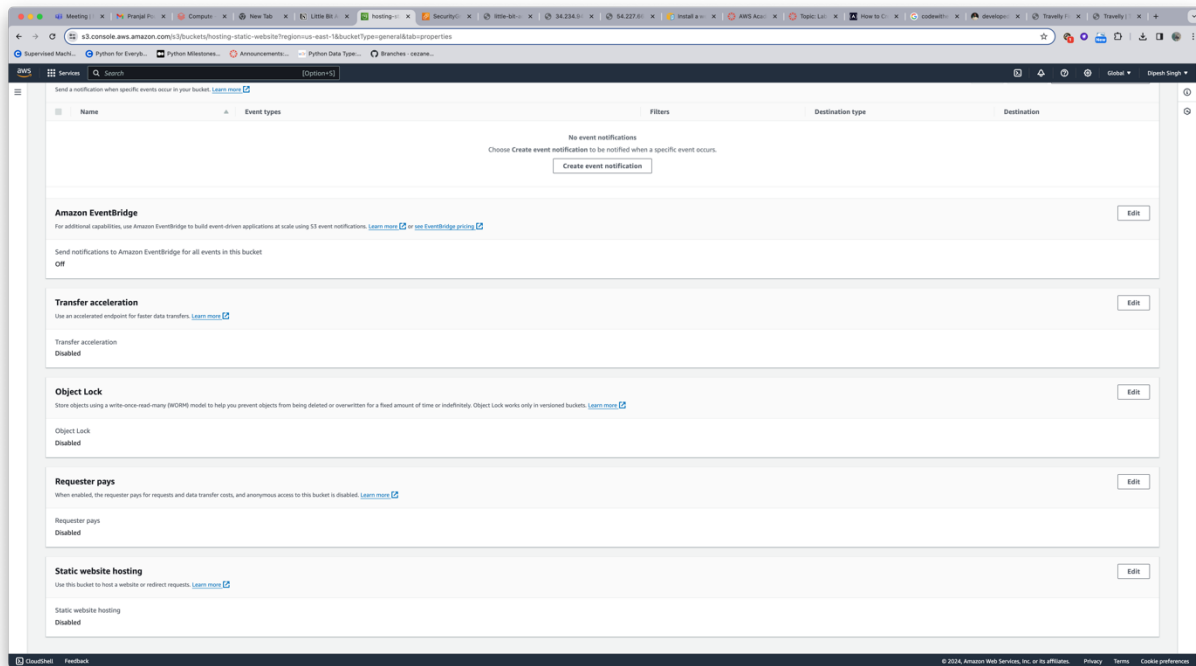

Configure the settings and create a bucket. Now let's add the website content to the bucket.

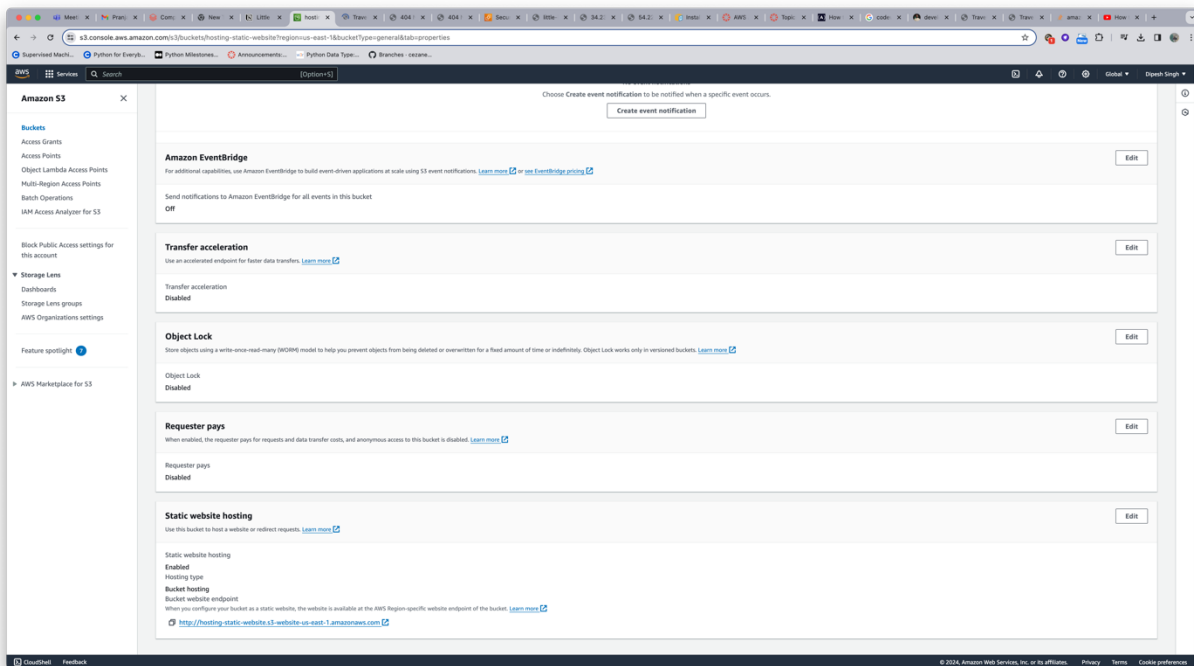

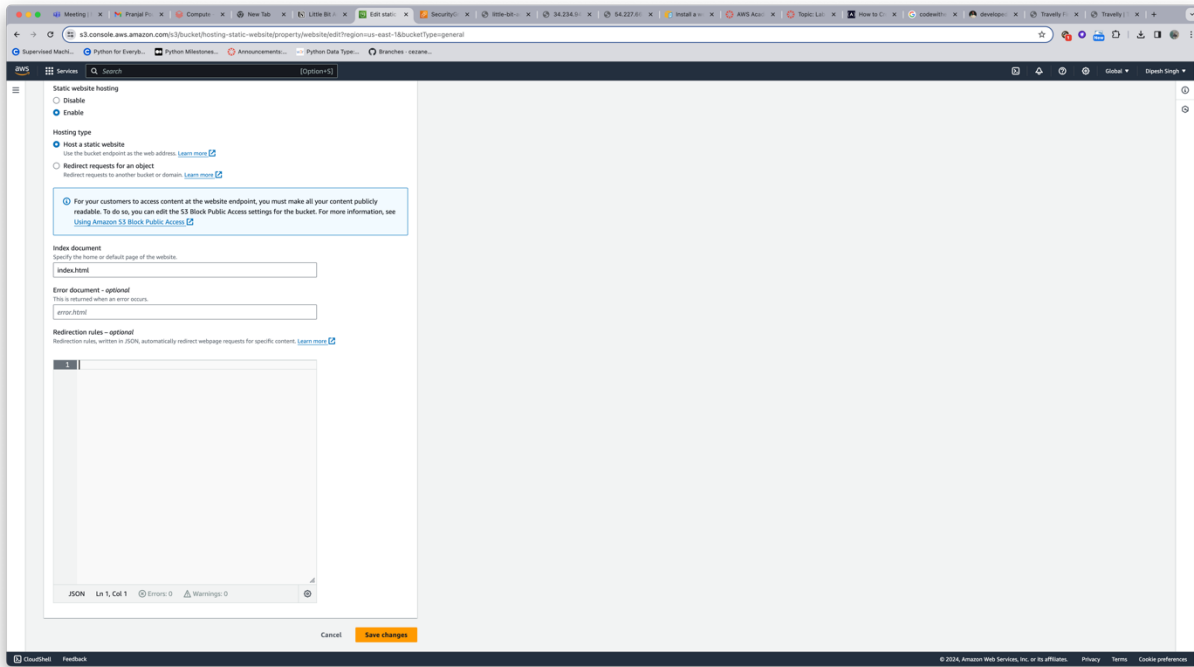

Go to permission tab of the bucket.

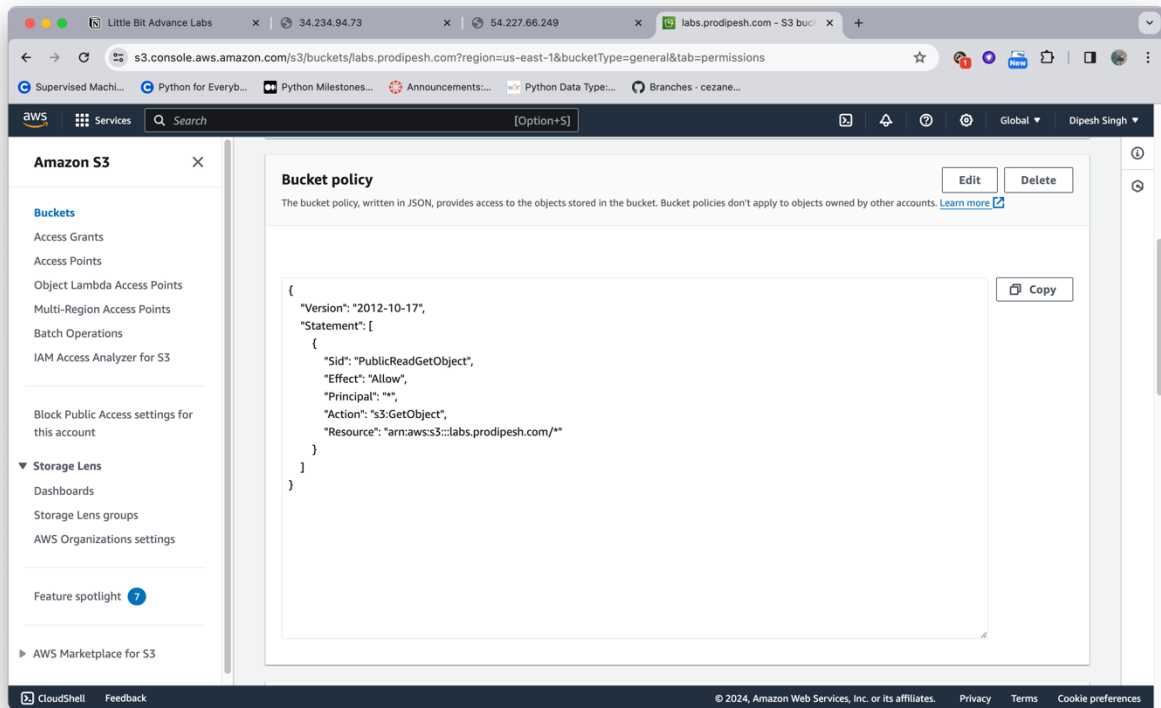

And at the bottom there is option for static website hosting. Click “Edit” button.

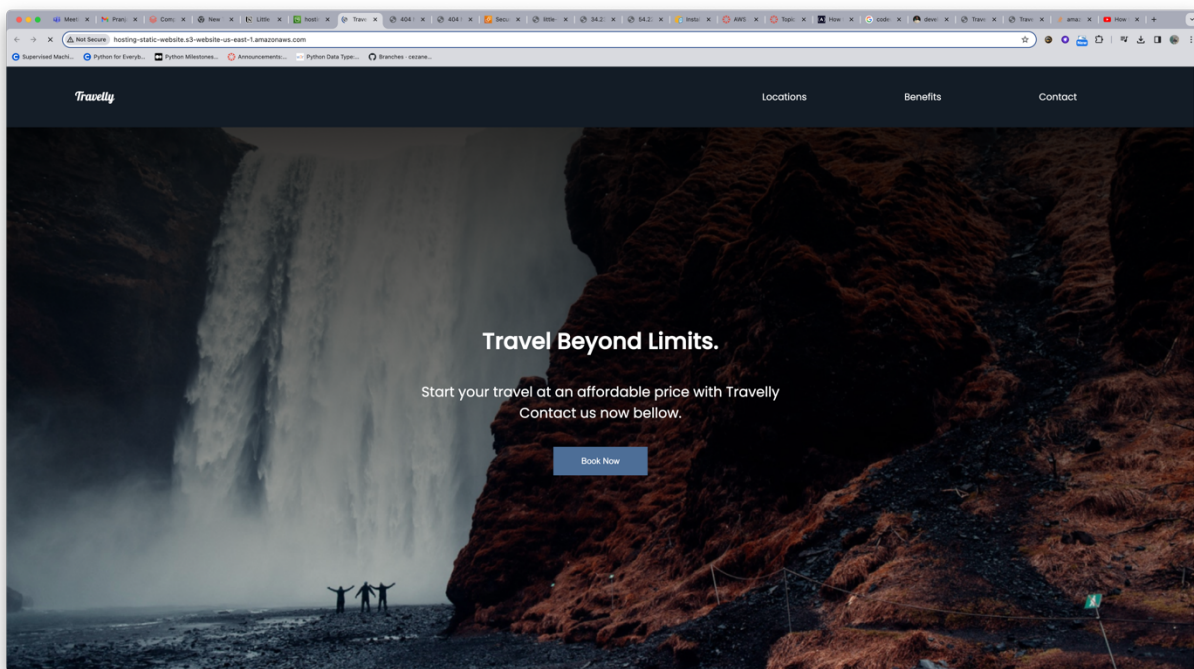

Configure the settings and click save changes.

Add some code to make the bucket public.

Now, lets try going to the website using the dns provided.

The website loads successfully.
