# Amazon Route 53

Now lets point a domain name to the S3 bucket.

Search for "Route 53" and click create button.

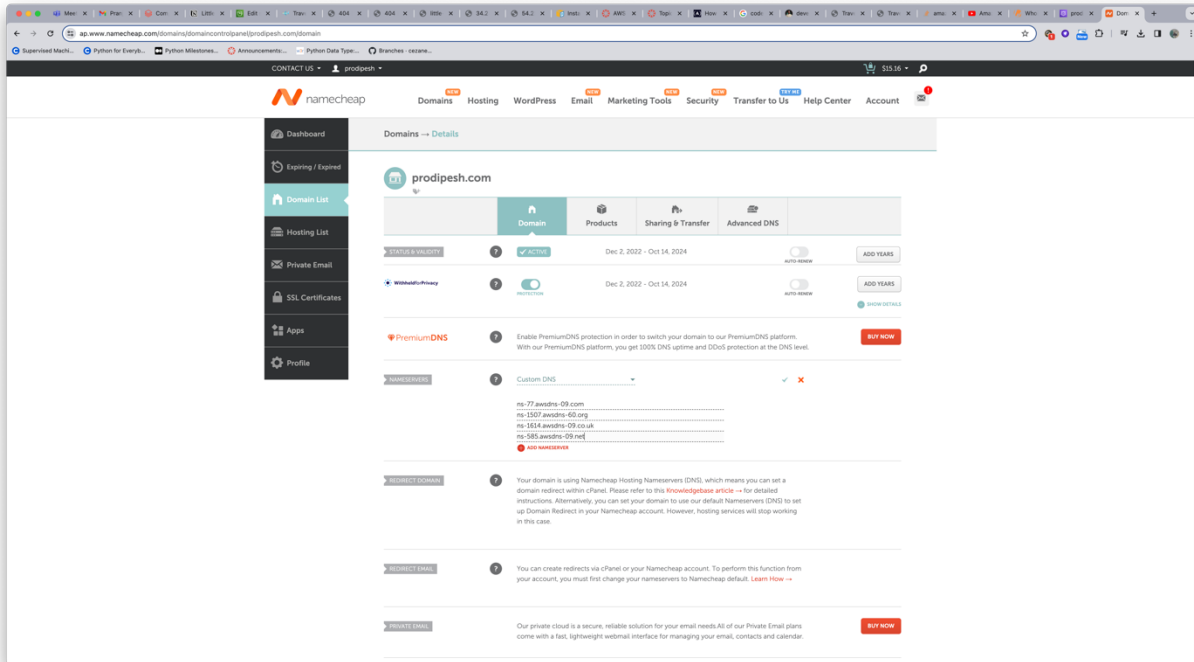

Since I already have a domain, I will select Create hosted zones.

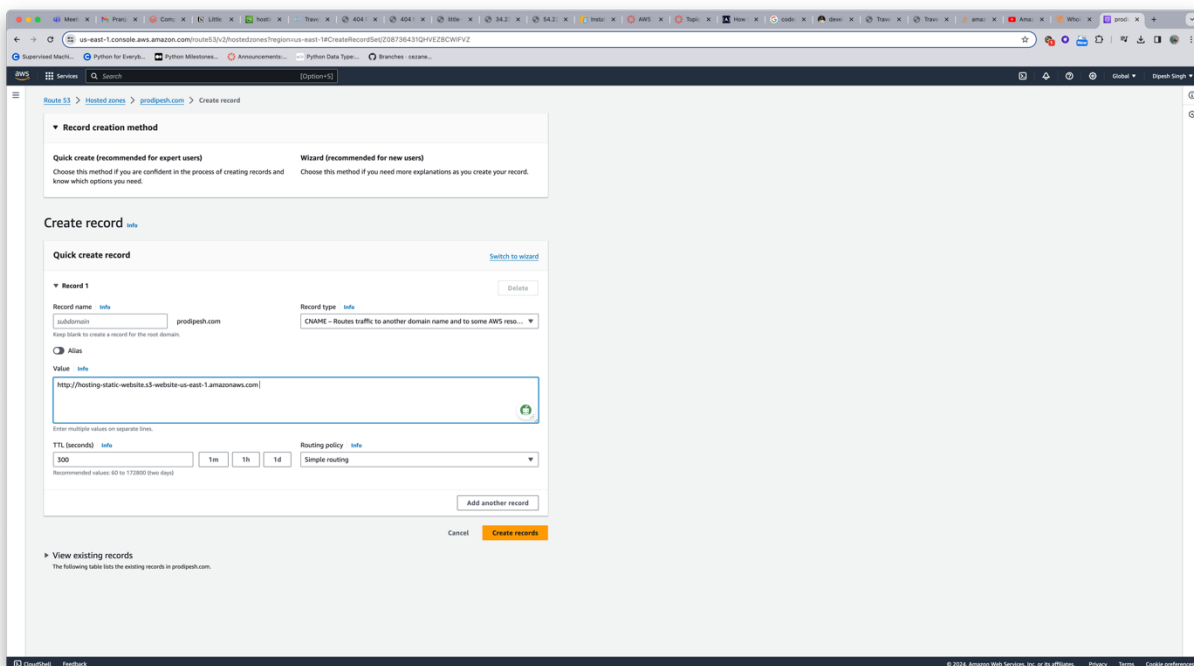

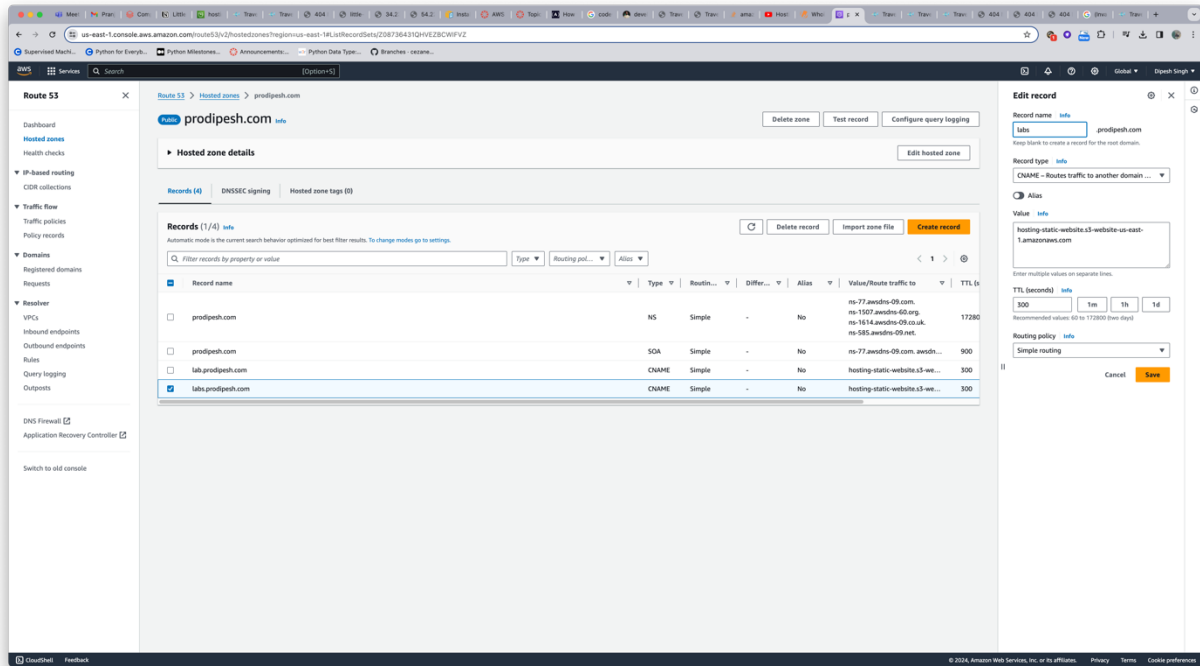

It is created successfully.

Now lets point the domain name (prodipesh.com) to the AWS using 4 nameservers provided to us.

I will go to my Domain Registrar and update the nameservers. (This may take from few seconds up to 48 hours)

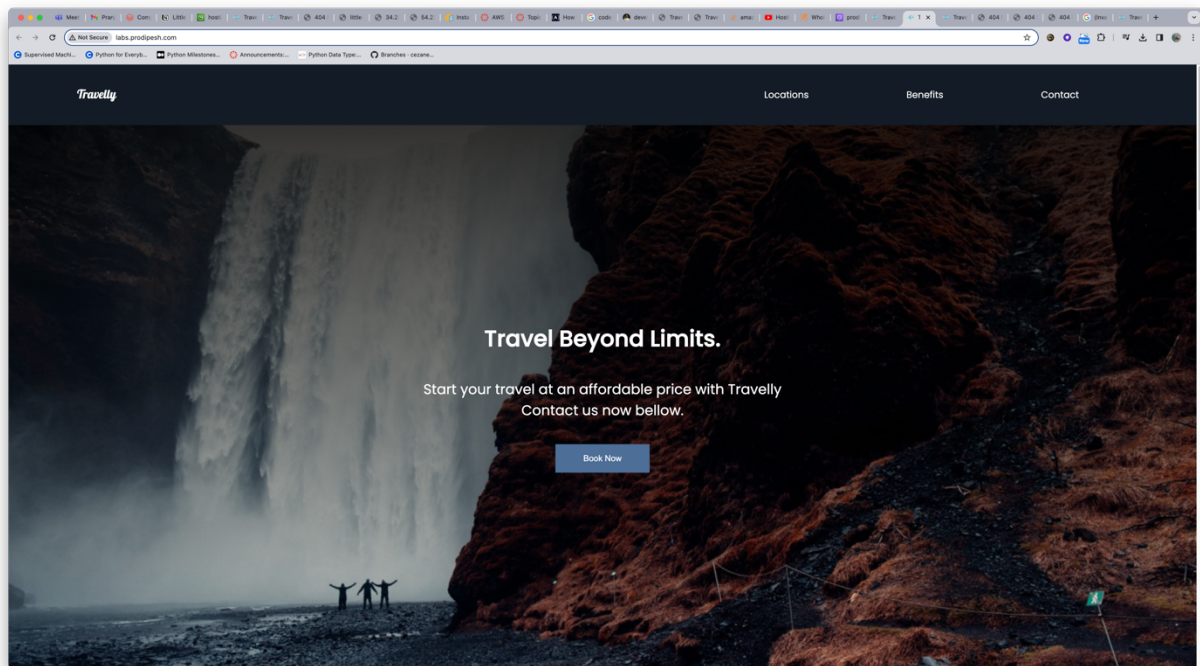

Now lets CNAME record to redirect it to our S3 bucket DNS.

Everything is set up so lets try accessing the website through domain name.

The website loads fine.
